

ONE TO ONE

A function f from $A \rightarrow B$ is called one to one, if whenever $f(a) = f(b)$, then $a = b$. No element of B is the image of more than one element in A .

A function is said to be injective if it's one to one function.

Example

Is it an one-to-one function?

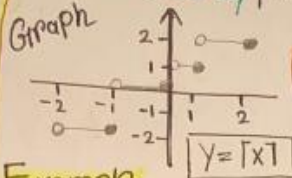

No, it's not an one-to-one function. Why? more than one element is paired with 2 in the codomain.

CEILING FUNCTION

The ceiling function assigns to the real number x the smallest integer that is greater than or equal to x .

The value of the ceiling function at x denoted by $\lceil x \rceil$.

Example

- $\lceil x \rceil$ ceiling function; the smallest integer $\geq x$
- $\lceil 2.3 \rceil = 3$
 - $\lceil 7 \rceil = 7$
 - $\lceil 1/2 \rceil = 1$

FLOOR FUNCTION

The floor function assigns to the real number x , the largest integer that is less than or equal to x .

The value of the floor function at x is denoted by $\lfloor x \rfloor$

Examples

- $\lfloor x \rfloor$ Floor function: the largest integer $\leq x$
- $\lfloor 2.3 \rfloor = 2$
 - $\lfloor 2 \rfloor = 2$
 - $\lfloor 0.5 \rfloor = 0$
 - $\lfloor -3.5 \rfloor = -4$

TYPES

There are many types of functions. They are:

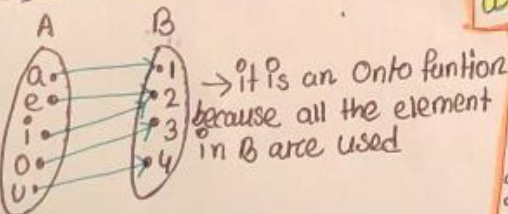

- one-to-one
- onto
- ceiling
- floor, etc.

ONTO

A function f from A to B is called onto if, for all 'b' in B , there is an 'a' in A , such that $f(a) = b$. All elements in B are used.

A function is said to be surjective if it is onto function.

Example

Because of this it is not an onto function because all four elements in the codomain are not the image of every element in the domain.

FUNCTION DEFINITION

Let A and B be non-empty sets. A function f from A to B is an assignment of element of B to each element of A . Such that one is unique element of B assigned to each element of A . We write $f(a) = b$ if b is an element of B assigned by the function f to each element a of A . If f is a function from A to B , we write $f: A \rightarrow B$. Functions are sometimes also called mapping or transformation.

Example of a function.

Which function is it? Is it a function or not?

- one to one function but not onto because all the elements in B are not used.
- It is both one to one and onto.
- it is not a function because it sends an element to two different elements.
- it is onto but not one to one because element 2 is paired with element 1 in the codomain.
- it is neither onto nor one to one because all four elements in the codomain are not the images of every element in the domain, so it is not onto function. Not one to one because more than one element is paired in the codomain.
